

For Non-Stop Printing on Bottle Bottoms or Active Transfer, Try this Bottomless Conveyor

DEITZ
COMPANY INC.
DATA SHEET

Printing lot codes, serial numbers and other markings on bottle bottoms has never been easier – or faster. The BCV1 Bottomless Conveyor automatically captures bottles or other containers from a standard conveyor and grips them between dual hugger belts while advancing them over a printer. When marked, the bottles are directed downstream to a companion turntable or conveyor. The entire process moves swiftly without stopping, slowing or interrupting the bottle's flow down the packaging line.

A Pharmafill BCV1 Bottomless Conveyor automatically carries bottles over a printer then transfers them onto a conveyor without slowing or stopping the line.

Companion printer available separately.

Versatility Included for Wide Variety of Containers

- Variable speed control to match line speed
- Quickly adjusts to suit container height, width
- Transfers bottles without passive diverters
- Can be mounted on standard conveyors or free-standing
- Comes with casters and leveling pads as standard

This Bottomless Conveyor Makes Traceability Compliance Easy, Affordable

The motorized Bottomless Conveyor serves as an active transfer mechanism. It moves containers from one point to another without relying on dead plates or other passive diverters that use back pressure from the containers. No tipping over, no spillage.

Dual hugger belts suspend bottles over printers, laser marking devices and other coding systems.

Adjustable lift stand option raises and lowers the hugger belt conveyor to accommodate a wide range of bottle sizes and ensure precise placement over printers.

Comes mounted on casters with leveling pads – just roll it up to the filling or packaging line.
